

Nemaglobe Sprayer Instructions: Environmental Factor recommends using the Nemaglobe Pre-calibrated 20 gallon hose end sprayer. If you already own an existing hose sprayer we cannot guarantee the settings or how long it will take for the nematodes to be dispersed.

General application tips:

- Add entire contents of nematodes to the applicator then fill with water to maximum fill level
- Choose flat spray type
- Apply to coverage area for at least 5 minutes in a side-to-side spraying motion
- Continue agitating sprayer throughout application

Below are the recommended settings for several types of sprayers:

• **Gilmour Wettable Powder Sprayer #405:** Insert nematodes into sprayer and fill the sprayer to maximum fill line. Set the sprayer to 4tsp/gallon.

Note: The majority of nematodes are sprayed out in first 5 minutes. After 10 minutes of spraying your nematodes will have been dispersed completely.

• **Gilmour Wet Sprayer #499:** Set sprayer to 4tsp/gallon or greater to ensure enough suction to move nematodes through the system.

• **Hudson Model Wed/dry Sprayer #2204:** Only use this sprayer with straw removed and in set the sprayer to dry (6oz) setting. For optimal performance turn sprayer upside down while spraying.

• **Miracle Gro Sprayer:** Insert nematodes into the sprayer. Fill with water to the maximum fill level. To ensure consistent nematode coverage, ensure spraying occurs over a maximum of 10 minutes. Note: The majority of nematodes are applied in the first 5 minutes of spraying. Agitate sprayer throughout application.
